Cognition AI — reconstructed case study

Devin, an autonomous software engineer

Reconstructed case study for DueDil.Agent testing · founded 2023 · San Francisco, USA · figures as of 2026

About this document

This is not the company's original pitch deck. It is a summary written from publicly reported facts so that DueDil.Agent has realistic input; the sources are listed on the last page. Where a figure is not public, the deck says [NOT_FOUND] on purpose — the pipeline is expected to flag it rather than guess.

Problem

Software teams spend a large share of their time on routine work: migrations, test coverage, ticket triage, dependency upgrades.

Solution

Devin, an agent that takes a ticket and works it end to end inside its own environment — editing, running tests and opening pull requests.

Traction

Enterprise deployments reported across financial services and technology customers; ARR figures are reported by press, not audited.

Positioning

Sells autonomous execution rather than assistance: output is a pull request, not a suggestion.

Team

Co-founded by Scott Wu (CEO); a team of competitive-programming backgrounds. About 15 engineers, each working alongside several Devin instances - the company's own description of how it scales.

Business model

Enterprise contracts priced against engineering capacity, with usage-based components.

Funding

$400M raised at a $10.2B valuation (2025); reported acquisition of Windsurf the same year.

ARR

[NOT_FOUND] — the company has not published an audited ARR figure.

Market

[NOT_FOUND] — no audited TAM was published.
