Uber — Series B era (2011), reconstructed

On-demand black car service, expanding city by city

Reconstructed case study for DueDil.Agent testing · founded 2009 · San Francisco, USA · figures as of 2011 (Series B era)

About this document

This is not the company's original pitch deck. It is a summary written from publicly reported facts so that DueDil.Agent has realistic input; the sources are listed on the last page. Where a figure is not public, the deck says [NOT_FOUND] on purpose — the pipeline is expected to flag it rather than guess.

Problem

Getting a reliable car in a city is slow, opaque and expensive; payment is awkward and supply is unpredictable.

Solution

Tap a button, a car arrives, payment is automatic. Supply is managed centrally per city instead of by dispatch radio.

Market

Urban ground transportation. The 2011 deck framed it as the taxi and black-car market of a handful of launch cities, not a global TAM.

Traction (2011)

Operating in a small number of US cities, with the majority of trips in San Francisco; a few tens of thousands of trips per month.

Why it scales

Each new city is the same playbook: recruit drivers, seed demand, reach liquidity. Fixed product cost, repeating launch.

Business model

Per-ride commission. No fleet ownership, minimal marginal cost per additional trip.

Team

Travis Kalanick (CEO), Garrett Camp (chairman). About 30 employees in 2011.

Funding

Series B, December 2011: $32M, following a $11M Series A.

ARR

Not applicable at the time — Uber reported gross bookings, not recurring revenue.
